

New functionality. No new authority for its author.

G54B1: a working extension and an informative acceptance failure.

Observed functional work.
Final acceptance: INCOMPLETE.

HOW + WHAT → external author → candidate domain

Kernel, examiner and admission remain separate.

[Case appendix and evidence](#)

A team asked for training sessions, not an integration project.

Controlled synthetic request. Three sessions, each 90 minutes, on a natural full-size field.

DATE	REQUESTED / PERMITTED	RECORDED RESULT
7 Jan	16:30–18:00	Fixed
8 Jan	11:00–12:30 → 11:30–13:00	Only this date shifted +30 min
9 Jan	11:00–12:30	Fixed

EXACT: no complete valid set. With explicit consent: 3 sessions, 6,300 minor EUR (€63) under 7,000 (€70).

The author received interfaces, not a ready-made football implementation.

A general construction guide and a separate football task defined the work.

HOW TO BUILD

Work and Root
External DRS
provenance, time, admission

Numerical donor example:

$$3 \times x + 2$$

WHAT TO BUILD

Natural grass. Full-size field.
Three 90-minute sessions.
Time changes need consent.

Candidate output profile named the report fields for this subject.

AUTHOR candidate edits	BROKER observed tools	RUNNER confined test	NATIVE ROOTS local Work	EXAMINER review / stop
----------------------------------	---------------------------------	--------------------------------	-----------------------------------	----------------------------------

Four submissions changed the candidate, not its acceptance rules.

One fresh Astra authoring trial: initial submission and three bounded corrections.

00

Privacy boundary

DRS secret payload
forbidden

01

Key constraint

JSON key length $173 > 128$

02

Post-effect crash

registry mutation;
evidence serialization
failed

03

Useful execution

both workers rc0; frozen
exam STOP

gpt-6-astra / ultra · 429 broker operations · inference request count: UNKNOWN

The generated domain performed a real two-party computation.

Separate native Roots exchanged a computed offer through External DRS.

VENUE ROOT

EXTERNAL DRS

REQUESTER ROOT

Venue Work

computes an offer
from inventory

signed publication

descriptor + fetched body
with source references

Requester Work

consumes a verified
source context

Observed binding

The consumer received the published body and a later authenticated status projection.

Three reservations came from one recorded mock effect.

Final synthetic SHIFT run: one observed Host dispatch and effect in total.

3

RESERVATIONS

1

IDEMPOTENCY RECORD

1

TOTAL MOCK EFFECT

BOOK

REPEAT

VERIFY

same receipt + matching registry readback

An evidence-write failure did not undo an effect that had already happened.

Attempt 02 is a separate recorded earlier submission, not the final successful mock run.

- | | | |
|----|------------------------------|---|
| 01 | Mutation | Mock registry gained the booking state. |
| 02 | Evidence write failed | mappingproxy serialization raised an exception after mutation. |
| 03 | State was inspected | Saved registry and supervisor feedback exposed the real effect. |

The supervisor identified the post-effect failure; the runtime did not autonomously repair this crash.

Useful execution and final acceptance remained separate outcomes.

The frozen examiner stopped at venue_offer_consumption. The trial remains INCOMPLETE.

OBSERVED FUNCTIONAL RUN

Both peer workers rc0

**Three mock reservations,
receipt and readback**

ACCEPTANCE RECORD

INCOMPLETE

**First examiner stop:
venue_offer_consumption**

Not run after this stop: full adversarial matrix, live Gemini series, final two supplied proofs.

Preserved meaning does not require identical envelopes.

Three representations have distinct sources and causal positions.

B.offer = E

C.body = B

E ≠ B ≠ C

Independent implementation exposed an inconsistency in the contract.

The guide orders publication after producer Work and review; the frozen examiner required it inside Work.

PUBLIC HOW

1. Produce Venue Work
2. Review that Work
3. Publish B with both IDs

FROZEN EXAMINER

**Producer Work output
must equal the entire B.
Requester input must equal B.**

The author recorded this as a blocker in CORRECTION_03. A later independent reviewer verified the causal mismatch from saved values.

A recorded failure can reveal more than an unexplained green result.

This case kept both the useful work and the failed acceptance predicate visible.

- | | | |
|-----------|----------------------------|---|
| 01 | After-effect state | Attempt 02 mutated the registry before evidence serialization failed. |
| 02 | Bounded author role | Candidate corrections did not rewrite frozen examiner or owner admission. |
| 03 | Contract diagnosis | Actual E/B/C values distinguished result, publication and verified context. |

Interpretation: independent implementation tested the clarity of the shared instructions.

The next step is a corrected contract, not a rewritten past.

Each stage keeps its own version and acceptance record.

01

Archived G54B1

Observed work
INCOMPLETE acceptance

02

Contract correction

Versioned general $E \rightarrow B \rightarrow C$
rule
with independent checks

03

Separate future trial

Outcome UNKNOWN
until its own exam completes

The later numeric contract probe is a separate corrective exercise; it does not change the G54B1 result.

Inspect the work, the failure and the evidence behind both.

A source-bound case capsule separates recorded data, independent review and interpretation.

- 01 [Presentation PDF](#) Read the 13-slide case

- 02 [Technical appendix](#) Follow attempts, native traces and contract

- 03 [XML Reader + source map](#) Challenge each claim against recorded bytes

The system gained useful candidate functionality. Its author never became the authority that could declare it accepted.
