

Computing, assembled around intent

Three football sessions.

Natural grass. A EUR 70 limit.

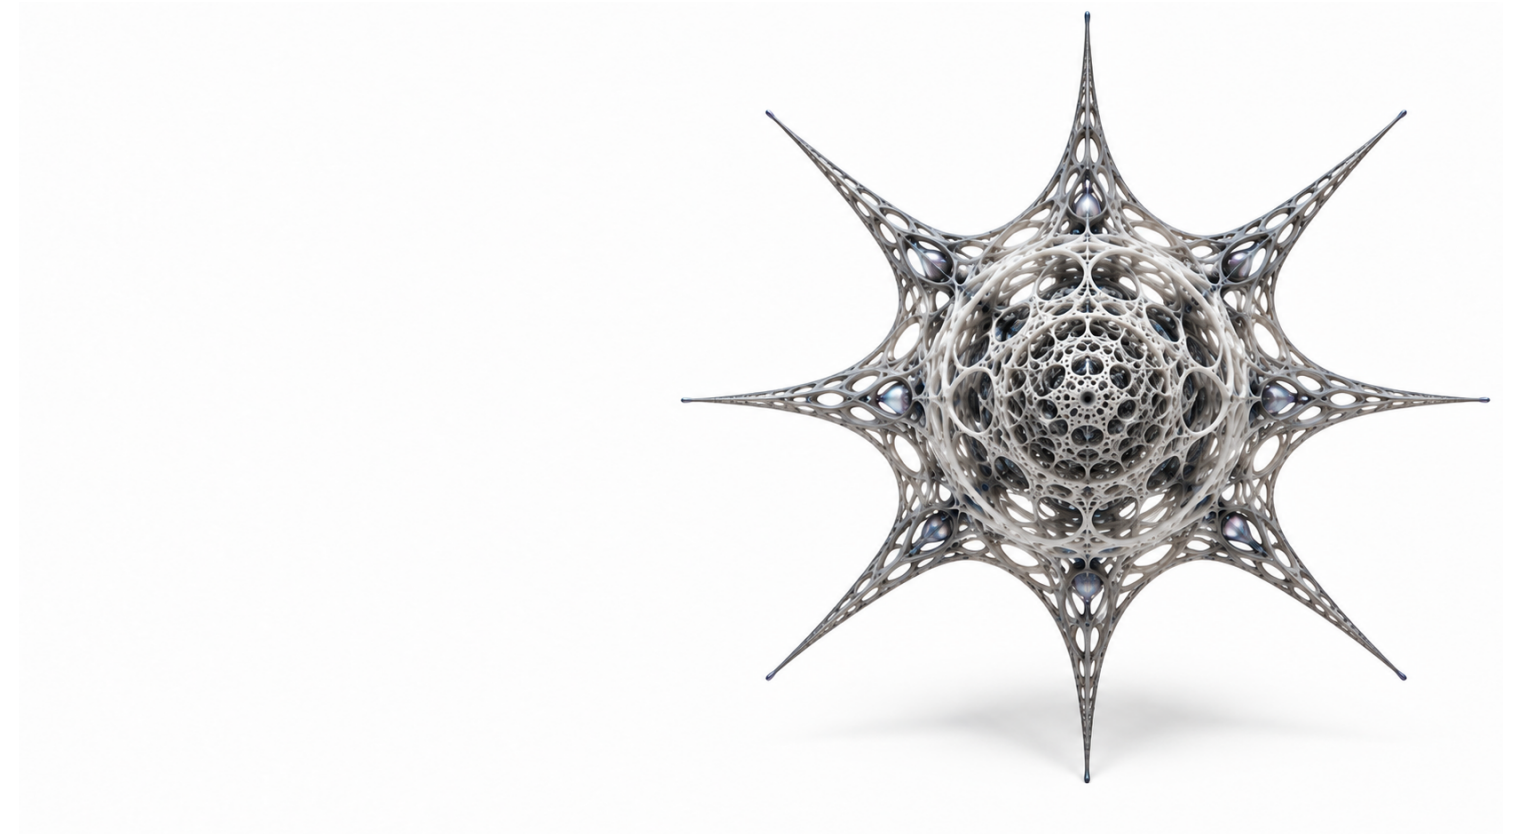

Compute an offer.

Check it with another owner.

Book only with separate consent.

An application execution kernel for models, code and services.

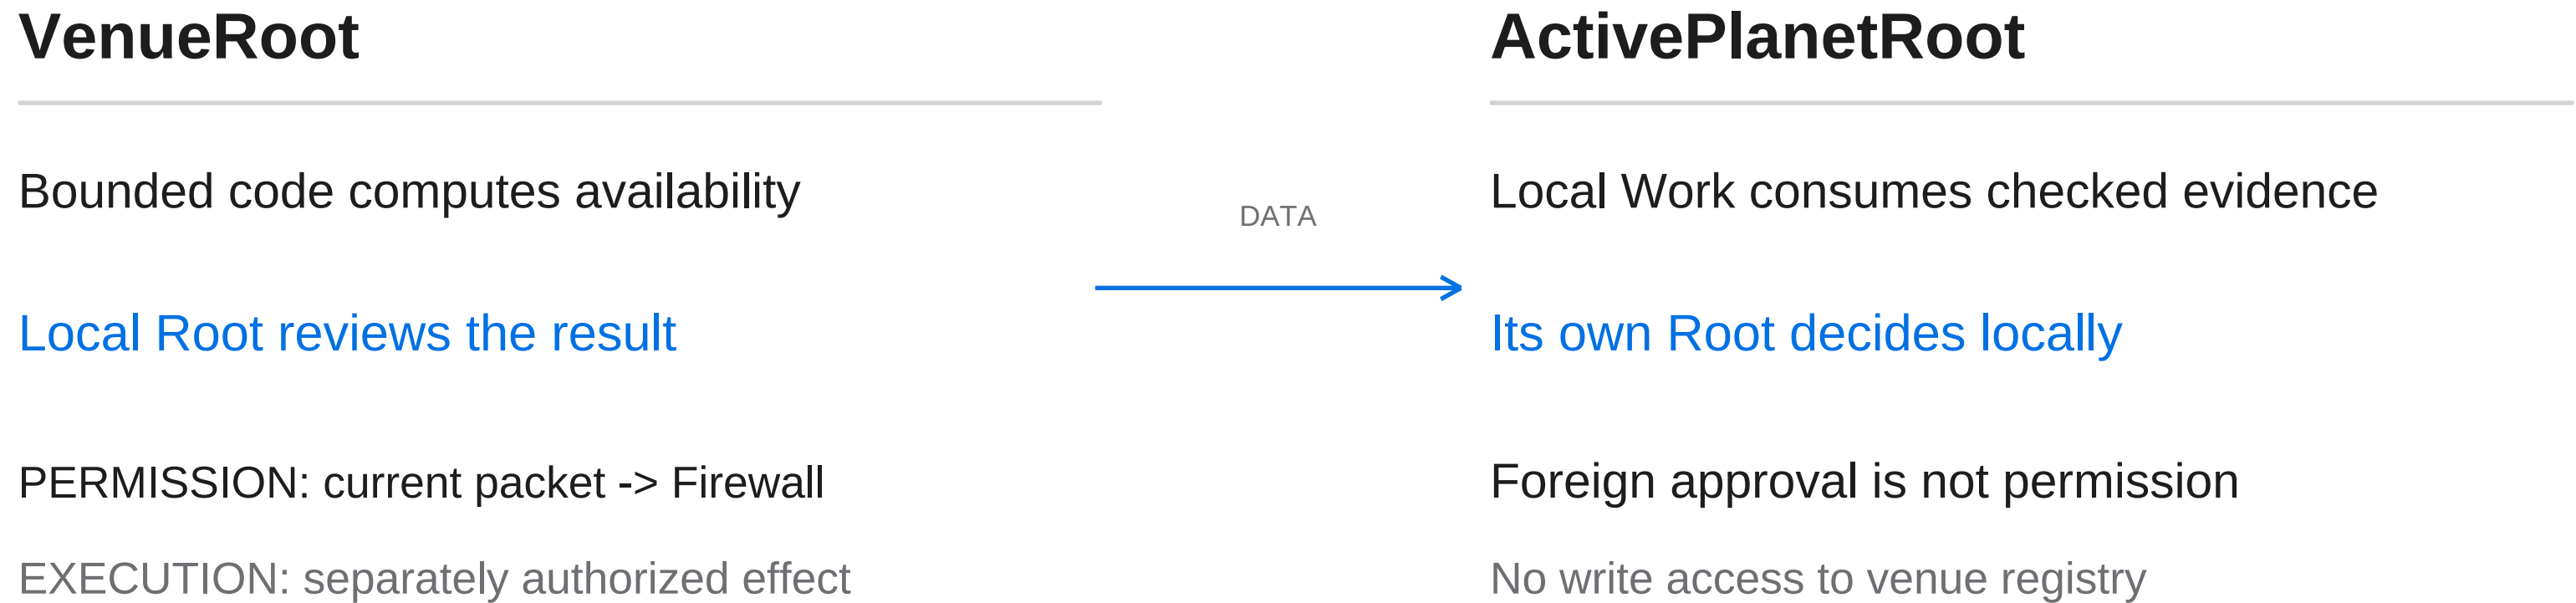

Recorded reference code. Mock effects. No new runtime campaign.

Approved conceptual artwork, not evidence.

Independent owners, useful work

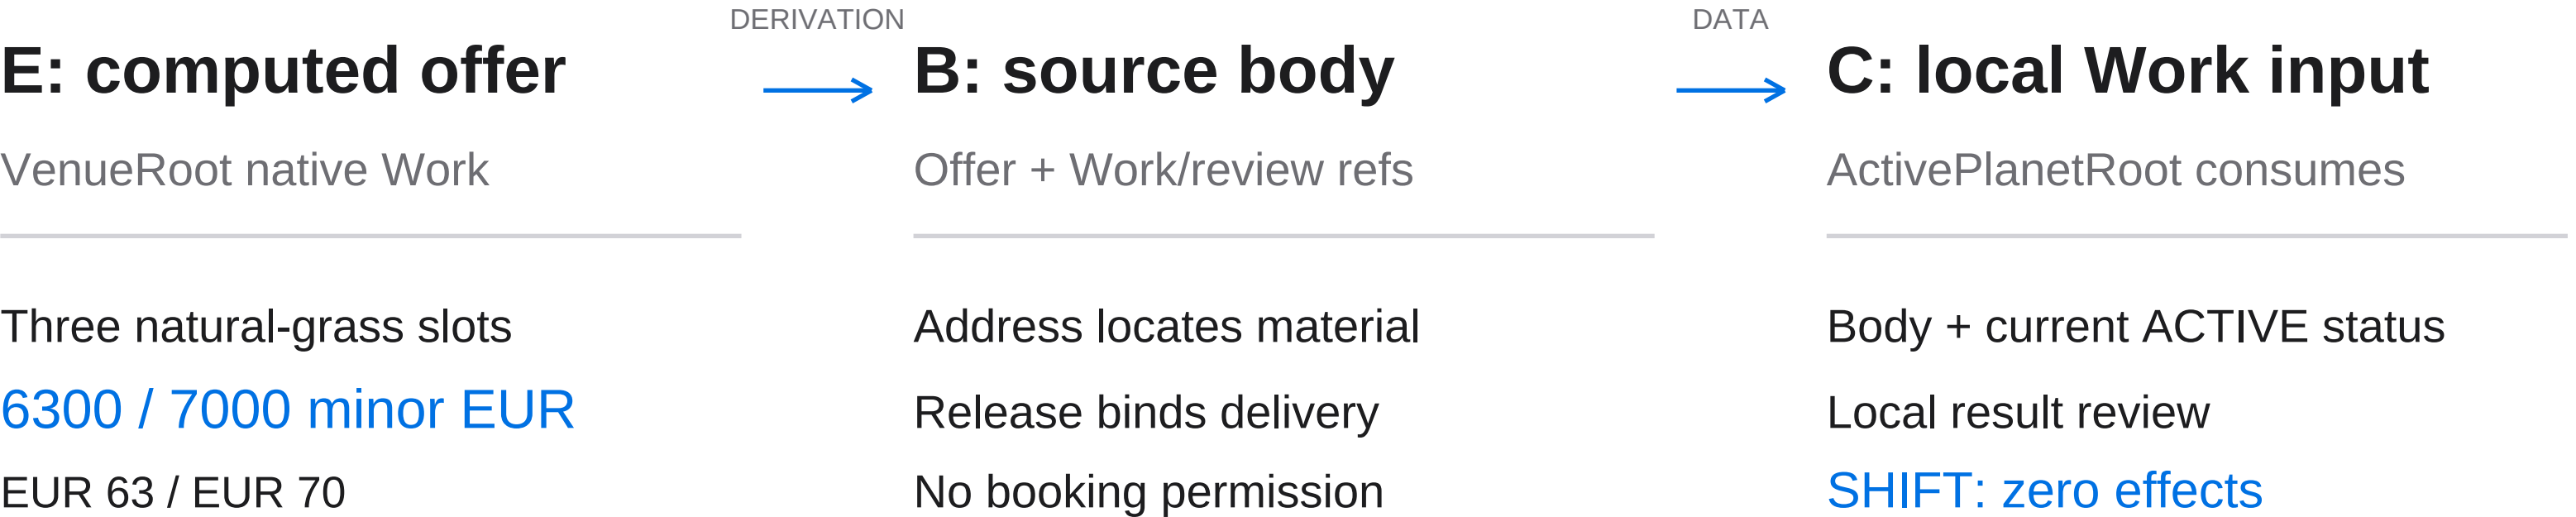

A user or event supplies an intention; semantic proposals are not permission.

Time and local memory inform each decision; neither retains action authority.

Typed Work can compose child Work. Runtime owns topology, not final authority.

A result crosses; permission does not

REVOKED -> status_not_active -> Root BLOCKED_FAIL_CLOSED

Native reason: hard_identity_violation. No successful consumer in that branch.

BOOK is separate: explicit consent -> VenueRoot -> one mock effect + receipt.

Authorship is not runtime permission

DESIGN TIME

G54D1 continued an existing lineage with authorized correction 4.

G54B1 and G54D remain INCOMPLETE. This was not one-shot authorship.

RUNTIME

New request -> current sources -> bounded Work -> local Root -> scoped effect

The audit Reader explains evidence; it is not the Authoring Kit or hidden oracle.

A visible fingerprint, not authority

Evidence object -> digest -> picture

Existing SVG and noncanonical PNG

Source files and output hashes inspected

No fresh repeatability or camera test

No image-to-hash recovery or ECC

No permission, signature or uniqueness proof

B1R3 NONCANONICAL PREVIEW

Lookup needs an explicit interface. A picture does not restore evidence or authority.
